Canine Atopic Dermatitis Study

Karen Farver, DVM, ACVD is currently recruiting cases for a canine atopic dermatitis study evaluating a new treatment. The study will begin **June 23rd, 2014.**

This treatment is designed to stop the allergic reaction and clinical signs of atopic dermatitis. To be in the study the client will need to commit to bringing the dog on day 0, day 28, and day 42 with a phone call on day 14 (please note that there is a 1/3 chance of receiving a placebo). The treatment will be administered on those days and there are no treatments to give at home. Concurrent medications are allowed on the study.

*This treatment has been found (from previous studies) to be safe at 6x times the dose that will be used in the study.*

The study treatment, office visits, examination, and diagnostic laboratory work is offered at no charge to the client. There is a financial incentive offered to the client upon completion of the study of $400.

To qualify, dogs must have atopic dermatitis. The patient cannot have cancer or an immunosuppressive disease. They can have other diseases or conditions if they are stable and being treated.

We are beginning to take appointments for visits now; however, space is limited. Interested clients in the canine atopic dermatitis study should contact dermatology at Metropolitan Veterinary Associates at (610) 666-1050.

Thank you!
